

### **Abstract of the Disclosure**

A cannula/needle combination for subcutaneous administration of an active substance, more particularly a medicinal active substance such as, for example, insulin, comprises an injection needle (N) and a cannula (1) surrounding the injection needle (N) in a snug fit. The inner cross-section of the cannula (1) and the outer cross-section of the needle (N) differ from each other such that between them at least one cavity (24) is configured for passing through the active substance.
